## Hands-On Machine Learning with Scikit-Learn and TensorFlow

Concepts, Tools, and Techniques to Build Intelligent Systems

By [Aurélien Géron](#)

**Publisher:** O'Reilly Media

**Release Date:** March 2017

**Pages:** 576

**Graphics in this book are printed in black and white.**

Through a series of recent breakthroughs, deep learning has boosted the entire field of machine learning. Now, even programmers who know close to nothing about this technology can use simple, efficient tools to implement programs capable of learning from data. This practical book shows you how.

By using concrete examples, minimal theory, and two production-ready Python frameworks—scikit-learn and TensorFlow—author Aurélien Géron helps you gain an intuitive understanding of the concepts and tools for building intelligent systems. You'll learn a range of techniques, starting with simple linear regression and progressing to deep neural networks. With exercises in each chapter to help you apply what you've learned, all you need is programming experience to get started.

- Explore the machine learning landscape, particularly neural nets
- Use scikit-learn to track an example machine-learning project end-to-end
- Explore several training models, including support vector machines, decision trees, random forests, and ensemble methods
- Use the TensorFlow library to build and train neural nets
- Dive into neural net architectures, including convolutional nets, recurrent nets, and deep reinforcement learning
- Learn techniques for training and scaling deep neural nets
- Apply practical code examples without acquiring excessive machine learning theory or algorithm details

# Machine Learning Notebooks

This project aims at teaching you the fundamentals of Machine Learning in python. It contains the example code and solutions to the exercises in my O'Reilly book [Hands-on Machine Learning with Scikit-Learn and TensorFlow](#):

Simply open the [Jupyter](#) notebooks you are interested in:

- Using [jupyter.org's notebook viewer](#)
  - note: [github.com's notebook viewer](#) also works but it is slower and the math formulas are not displayed correctly,
- or by cloning this repository and running Jupyter locally. This option lets you play around with the code. In this case, follow the installation instructions below.

# New Second Edition

9

## □ Tensor Flow 2.0

# 3 Sources --- 3 Perspectives

10

# Big Data

11

- Widespread use of personal computers and wireless communication leads to “big data”
- We are both producers and consumers of data
- Data is not random, it has structure, e.g., customer behavior
- We need “big theory” to extract that structure from data for
  - (a) Understanding the process
  - (b) Making predictions for the future

# Why “Learn” ?

12

- Machine learning is programming computers to optimize a performance criterion using example data or past experience.
- There is no need to “learn” to calculate payroll
- Learning is used when:
  - ▣ Human expertise does not exist (navigating on Mars),
  - ▣ Humans are unable to explain their expertise (speech recognition)
  - ▣ Solution changes in time (routing on a computer network)
  - ▣ Solution needs to be adapted to particular cases (user biometrics)

# What We Talk About When We Talk About “Learning”

13

- Learning general models from a data of particular examples
- Data is cheap and abundant (data warehouses, data marts); knowledge is expensive and scarce.
- Example in retail: Customer transactions to consumer behavior:  
*People who bought “Blink” also bought “Outliers”*  
([www.amazon.com](http://www.amazon.com))
- Build a model that is *a good and useful approximation* to the data.

# Data Mining

14

- Retail: Market basket analysis, Customer relationship management (CRM)
- Finance: Credit scoring, fraud detection
- Manufacturing: Control, robotics, troubleshooting
- Medicine: Medical diagnosis
- Telecommunications: Spam filters, intrusion detection
- Bioinformatics: Motifs, alignment
- Web mining: Search engines
- ...

# What is Machine Learning?

15

- Optimize a performance criterion using example data or past experience.
- Role of Statistics: Inference from a sample
- Role of Computer science: Efficient algorithms to
  - ▣ Solve the optimization problem
  - ▣ Representing and evaluating the model for inference

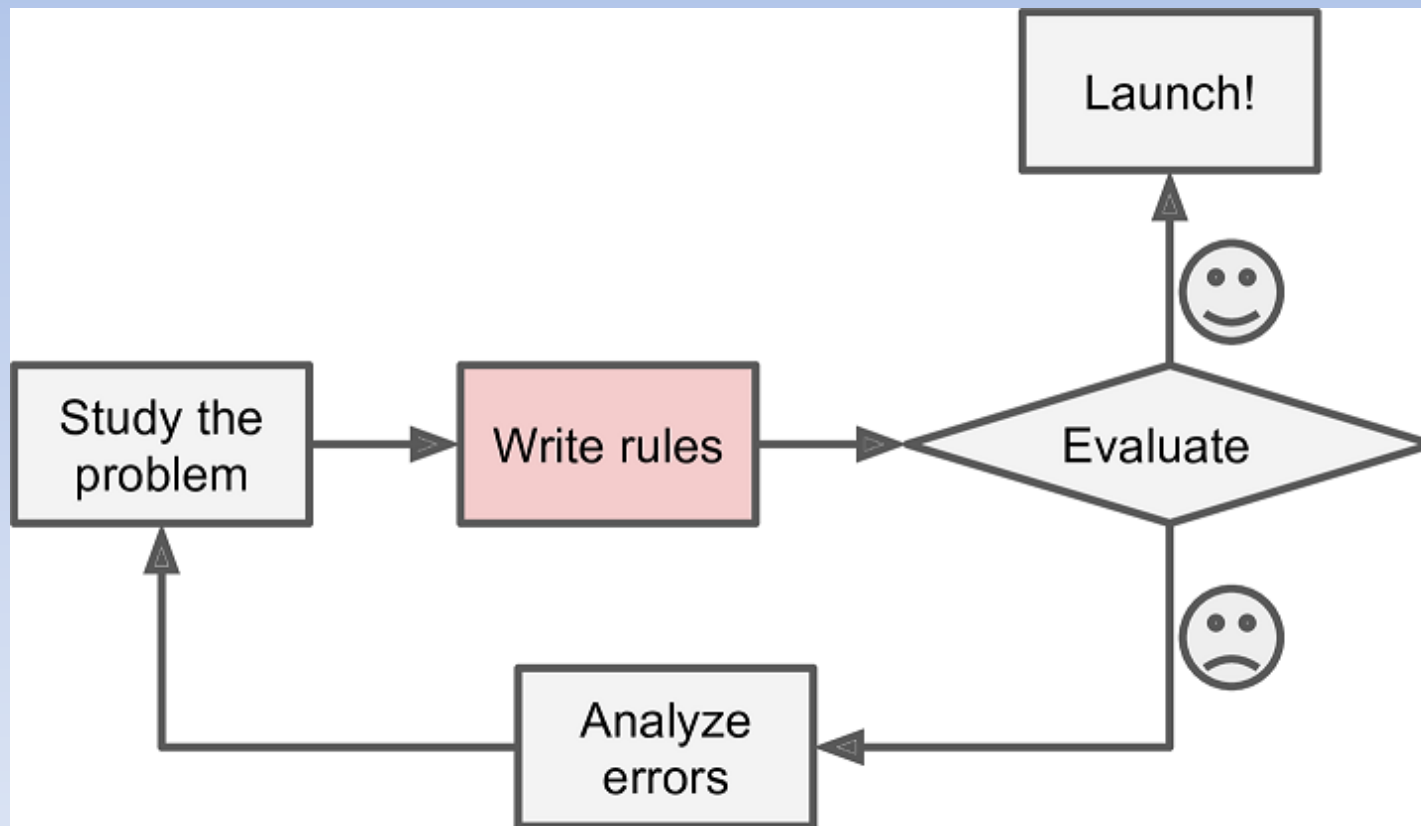

# Hands-On Why Machine Learning?

# Hands-On Why Machine Learning?

- Machine Learning Can Aid Understanding.

# Applications / Types of Machine Learning

21

- Association
- Supervised Learning
  - ▣ Classification
  - ▣ Regression
- Unsupervised Learning
- Reinforcement Learning

# Learning Associations

22

- Basket analysis:

$P(Y | X)$  probability that somebody who buys  $X$  also buys  $Y$  where  $X$  and  $Y$  are products/services.

Example:  $P(\text{chips} | \text{beer}) = 0.7$

### Online Retail Data Set

Download: [Data Folder](#), [Data Set Description](#)

**Abstract:** This is a transnational data set which contains all the transactions occurring between 01/12/2010 and 09/12/2011 for a UK-based and registered non-store online retail.

<b>Data Set Characteristics:</b>	Multivariate, Sequential, Time-Series	<b>Number of Instances:</b>	541909	<b>Area:</b>	Business
<b>Attribute Characteristics:</b>	Integer, Real	<b>Number of Attributes:</b>	8	<b>Date Donated</b>	2015-11-06
<b>Associated Tasks:</b>	Classification, Clustering	<b>Missing Values?</b>	N/A	<b>Number of Web Hits:</b>	288593

Graph for 10 rules

# Supervised Learning: Classification

24

- Example: Credit scoring
- Differentiating between **low-risk** and **high-risk** customers from their *income* and *savings*

**Discriminant:** IF *income*  $> \theta_1$  AND *savings*  $> \theta_2$   
THEN **low-risk** ELSE **high-risk**

# Classification: Applications

25

- Aka Pattern recognition
- Face recognition: Pose, lighting, occlusion (glasses, beard), make-up, hair style
- Character recognition: Different handwriting styles.
- Speech recognition: Temporal dependency.
- Medical diagnosis: From symptoms to illnesses
- **Biometrics**: Recognition/authentication using physical and/or behavioral characteristics: Face, iris, signature, etc
- Outlier/novelty detection:

# Face Recognition

## About Aadhaar

Aadhaar number is a 12-digit random number issued by the UIDAI ("Authority") to the residents of India after satisfying the verification process laid down by the Authority. Any individual, irrespective of age and gender, who is a resident of India, may voluntarily enrol to obtain Aadhaar number. Person willing to enrol has to provide minimal demographic and biometric information during the enrolment process which is totally free of cost. An individual needs to enrol for Aadhaar only once and after de-duplication **only one Aadhaar** shall be generated, as the **uniqueness** is achieved through the process of demographic and biometric de-duplication.

### Demographic information

Name, Date of Birth (verified) or Age (declared), Gender, Address, Mobile Number (optional) and Email ID (optional)

### Biometric information

Ten Fingerprints, Two Iris Scans, and Facial Photograph

# Classification: R&N CH18

## 1.2. Supervised learning

3

(a)

D features (attributes)			Label
Color	Shape	Size (cm)	
Blue	Square	10	1
Red	Ellipse	2.4	1
Red	Ellipse	20.7	0

(b)

- Learn a function from examples
- $f$  is the target function
- An example is an input-output pair:  $(x, f(x))$
- Problem:
  - Given a hypothesis space  $H$
  - Given a training set of examples:  $(x_1, f(x_1)), \dots, (x_n, f(x_n))$
  - Find a hypothesis  $h(x)$  such that  $h \sim f$

# Restaurant Example w/ R&N CH18

- Wait for a table????
- Goal Predicate: WillWait
- Attributes:
  - **Alternate:** whether there is a suitable alternative restaurant nearby.
  - **Bar:** whether the restaurant has a comfortable bar area to wait in.
  - **Fri/Sat:** true on Fridays and Saturdays.
  - **Hungry:** whether we are hungry.
  - **Patrons:** how many people are in the restaurant (values are None, Some, and Full).
  - **Price:** the restaurant's price range (\$, \$\$, \$\$\$).
  - **Raining:** whether it is raining outside.
  - **Reservation:** whether we made a reservation.
  - **Type:** the kind of restaurant (French, Italian, Thai, or burger).
  - **WaitEstimate:** the wait estimated by the host (0–10 minutes, 10–30, 30–60, or >60).

# Restaurant Example

Example	Input Attributes										Goal
	<i>Alt</i>	<i>Bar</i>	<i>Fri</i>	<i>Hun</i>	<i>Pat</i>	<i>Price</i>	<i>Rain</i>	<i>Res</i>	<i>Type</i>	<i>Est</i>	<i>WillWait</i>

# Regression

□ Example: Price of a used car

□  $x$  : car attributes

$y$  : price

$$y = g(x \mid \theta)$$

$g(\cdot)$  model,

$\theta$  parameters

# Regression Applications

34

- Navigating a car: Angle of the steering
- Kinematics of a robot arm

$$\alpha_1 = g_1(x, y)$$

$$\alpha_2 = g_2(x, y)$$

■ Response surface design

# Supervised Learning: Uses

35

- **Prediction of future cases:** Use the rule to predict the output for future inputs
- **Knowledge extraction:** The rule is easy to understand
- **Compression:** The rule is simpler than the data it explains
- **Outlier detection:** Exceptions that are not covered by the rule, e.g., fraud

# Unsupervised Learning

36

- Learning “what normally happens”
- No output
- Clustering: Grouping similar instances
- Example applications
  - ▣ Customer segmentation in CRM
  - ▣ Image compression: Color quantization
  - ▣ Bioinformatics: Learning motifs

# Reinforcement Learning

37

- Learning a policy: A **sequence** of outputs
- No supervised output but delayed reward
- Credit assignment problem
- Game playing
- Robot in a maze
- Multiple agents, partial observability, ...

# Reinforcement Learning w/ Hands-On

- 1 Observe
- 2 Select action using policy
- 3 Action!
- 4 Get reward or penalty
- 5 Update policy (learning step)
- 6 Iterate until an optimal policy is found

# Reinforcement Learning

## R&N Chapter 21

(a)

(b)

**Figure 21.1** (a) A policy  $\pi$  for the  $4 \times 3$  world; this policy happens to be optimal with rewards of  $R(s) = -0.04$  in the nonterminal states and no discounting. (b) The utilities of the states in the  $4 \times 3$  world, given policy  $\pi$ .

# Challenges

# Challenges:

## Insufficient Quantity of Training Data

- Many Algorithms do well with enough data!

# Challenges:

## Nonrepresentative Training Data

- In order to generalize well, it is crucial that your training data be representative of the new cases you want to generalize to.

# Challenges: Overfitting/Underfitting

# Challenges:

- Poor-Quality Data
- Irrelevant Features

# Resources: Datasets

45

- Google Dataset Search:
  - ▣ <https://datasetsearch.research.google.com/>
- UCI Repository: <http://www.ics.uci.edu/~mlearn/MLRepository.html>
- Statlib: <http://lib.stat.cmu.edu/>
- Kaggle: <http://kaggle.com>

# Summary

- Machine Learning is about making machines get better at some task by learning from data, instead of having to explicitly code rules.
- There are many different types of ML systems
- In a ML project you gather data in a training set, and you feed the training set to a learning algorithm.
  - If the algorithm is model-based it tunes some parameters to fit the model to the training set, and then hopefully it will be able to make good predictions on new cases as well.
  - If the algorithm is instance-based, it just learns the examples by heart and uses a similarity measure to generalize to new instances.
- The system will not perform well if your training set is :
  - too small,
  - not representative, noisy, or polluted with irrelevant features (garbage in, garbage out).
- Lastly, your model needs to be neither too simple (in which case it will underfit) nor too complex (in which case it will overfit).
